## Task 2-Experimentation and Uplift testing

Julia has asked us to evaluate the performance of a store trial which was performed in stores 77, 86 and 88.

This can be broken down by:

- 1. total sales revenue
- 2. total number of customers
- 3. average number of transactions per customer

Create a measure to compare different control stores to each of the trial stores to do this write a function to reduce having to re-do the analysis for each trial store. Consider using Pearson correlations or a metric such as a magnitude distance e.g. 1- (Observed distance – minimum distance)/(Maximum distance – minimum distance) as a measure.

Once you have selected your control stores, compare each trial and control pair during the trial period. You want to test if total sales are significantly different in the trial period and if so, check if the driver of change is more purchasing customers or more purchases per customers etc.

Main areas of Focus are:

- 1. Select control stores Explore data, define metrics, visualize graphs
- 2. Assessment of the trial insights/trends by comparing trial stores with control stores
- 3. Collate findings summarize and provide recommendations

```
In [1]: import pandas as pd
import matplotlib.pyplot as plt
%matplotlib inline
import numpy as np

In [2]: qvi = pd.read_csv("QVI_data.csv")
qvi.head()
```

Out[2]:		LYLTY_CARD_NBR	DATE	STORE_NBR	TXN_ID	PROD_NBR	PROD_NAME	PROD_QTY	TOT_SAL

    Trial store 86: Store 155
    Trial store 88: Store 40
```

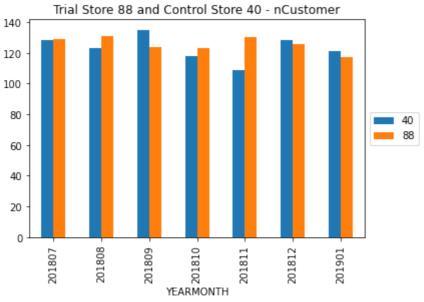

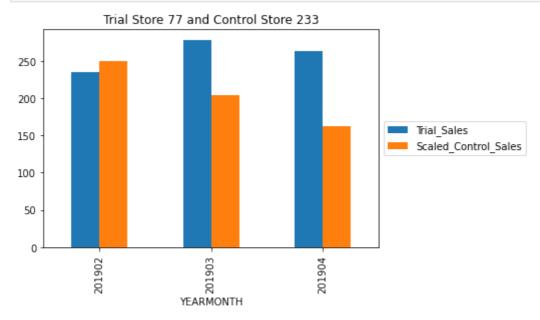

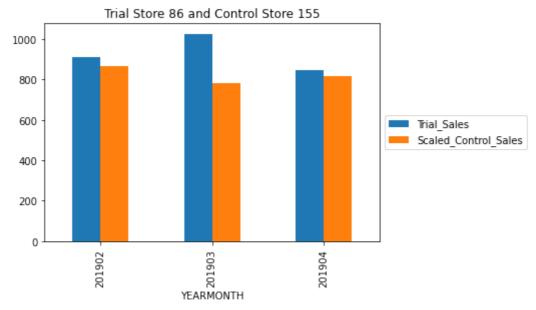

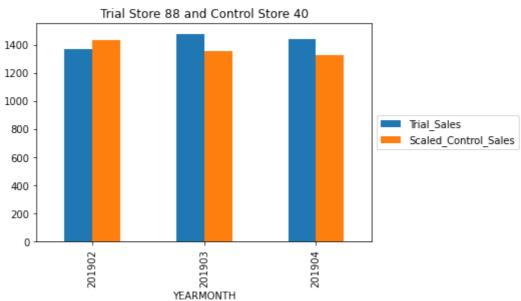

Next we'll compare the performance of Trial stores to Control stores during the trial period. To ensure their performance is comparable during Trial period, we need to scale (multiply to

ratio of trial / control) all of Control stores' performance to Trial store's performance during pre-trial. Starting with TOT\_SALES.

Check significance of Trial minus Control stores TOT\_SALES Percentage Difference Pre-Trial vs Trial.

Step 1: Check null hypothesis of 0 difference between control store's Pre-Trial and Trial period performance.

Step 2: Proof control and trial stores are similar statistically

Check p-value of control store's Pre-Trial vs Trial store's Pre-Trial. If <5%, it is significantly different. If >5%, it is not significantly different (similar).

Step 3: After checking Null Hypothesis of first 2 step to be true, we can check Null Hypothesis of Percentage Difference between Trial and Control stores during pre-trial is the same as during trial.

Check T-Value of Percentage Difference of each Trial month (Feb, March, April 2019). Mean is mean of Percentage Difference during pre-trial. Standard deviation is stdev of Percentage Difference during pre-trial. Formula is Trial month's Percentage Difference minus Mean, divided by Standard deviation. Compare each T-Value with 95% percentage significance critical t-value of 6 degrees of freedom (7 months of sample - 1)
